

Installation Guide 2021

**TRACCS Mobile App
FOR TECHNICAL PERSONNEL**

Last Update: 25th March 2021

1 INTRODUCTION

This manual covers the installation of the new TRACCS Mobile App (2021).

This software consists of the Time and Attendance App apk files, matching web service, and readiness scripts. This manual's information supersedes any software installation information contained in the old app version (2020).

Adamas can support clients during the Testing Phase and Go Live, but it will involve a service fee for project management services.

2 ENVIRONMENT

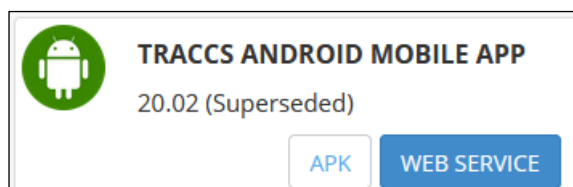

The files provided to the client must be used in a test environment before launching in the live database.

The test environment must be prepared before running the test files by complying with System Requirements and the Installation Plan provided in this guide.

3 SYSTEM REQUIREMENTS

1. TRACCS DESKTOP and OLD APP VERSION

NB: If you are running an older version of MTA, you must update this to the latest 20.02 version of the app before updating the TRACCS desktop. The latest version of TRACCS Desktop (21.01 onwards) makes some changes to support the new mobile app's functionality, which is incompatible with very old versions of the previous app.

Technical personnel can download the latest version at www.adamas.net.au – Downloads - TRACCS Version Updates.

In the test environment, the desktop TRACCS must be version no# 21.01 or later, designed to work with the new app; otherwise, the mobile app will not operate successfully.

The TRACCS database must be updated in the correct version order.

For advice, contact Iain Jordinson at jordo@systemet.com.au. Calls to Systemet may involve a service call fee. It is advisable to get copies of the [release notes 2021](#) and [release notes 2020](#) for any updates to ensure users know the changes in daily processes.

2. MOBILE DEVICE COMPATIBILITY

Android version 7 upwards (Phone & Tablet)

IOS requires iOS 9.0 or later (iPhone, iPad).

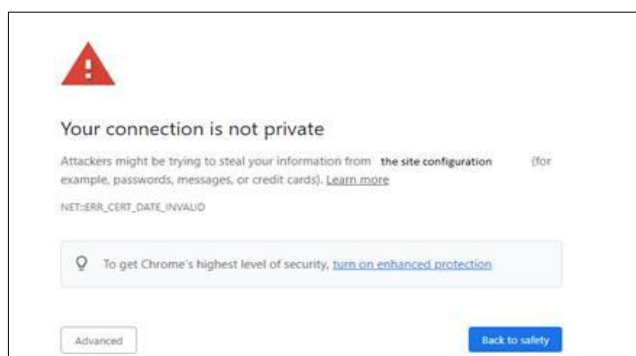

There are a few different reasons that you may be getting the “app is not optimised for your device” message on Google Playstore when attempting to download the app; they include:

- You need to **clear your cache**
- You need to update your Android version to the newest version
- You may not have enough space on your device to download the assets
- You have a **less powerful CPU** than is necessary
- Your screen configuration is incompatible with the app
- Your device is too old for the latest updates

The mobile app will still download regardless of this message on devices with Android 7 upwards, and this message is only a warning. If you are running earlier versions of Android, Google will block the mobile app from downloading. The block is Google Policy and has nothing to do with Adamas Corporate Solutions.

3. SSL CERTIFICATE UPDATES CRITICAL TO OPERATE NEW APP

If your TRACCS Mobile App server link uses HTTPS and not HTTP, then this is critical information. This information does not affect sites that use an HTTP server link.

When you use an HTTPS server link, it relies on the existence and currency of an SSL Certificate. An SSL certificate is a digital certificate that provides authentication for a website and enables an encrypted connection. These certificates communicate to the client that the web service host demonstrated ownership of the domain to the certificate authority at the time of certificate issuance. To properly use an HTTPS connection, agencies MUST purchase and keep current a SSL certificate.

Does your SSL certificate need renewing? If clients wish to install or upgrade the new TRACCS Mobile App, it is time to check the end date of your SSL certificate or purchase one.

Otherwise, the TRACCS Mobile App will not operate and will be blocked when trying to access the TRACCS database on your server.

If an SSL certificate is not configured correctly or expired, the web service will respond with a screen similar to the below, and the app will not be able to connect to the server.

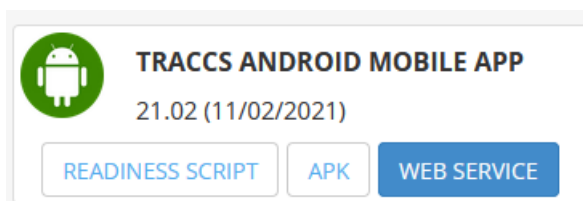

If you are using HTTPS for a server connection and the SSL certificate is expired or not available, you will need to correct the issue with your SSL certificate or configure web service access with HTTP protocol instead of HTTPS.

4 SOFTWARE PACK

The files provided in the software pack are:

1. Mobile app file for Android (IOS in App Store)
2. Matching web service
3. Readiness scripts

The software pack is available on the Adamas website. Technical personnel can download the latest version at www.adamas.net.au – Downloads - TRACCS Version Updates.

The app version is Android, but you will need the web service and readiness script for IOS. Download the IOS app file from Apple Store.

5 SECURITY

The app is programmed to remove all files/preferences on uninstall for security reasons. When employees resign, and the app is uninstalled from their phone, no links to the agencies' database are left behind. Set server links in the app's settings are deleted on uninstalled and will have to be reset on install.

6 IMPORTANT DATES

8th February 2021 – New TRACCS Mobile App (2021) goes live.

29th March 2021 – Users will not be able to download the Old TRACCS MTA (2020) version from App Stores.

7 INSTALLATION PLAN

STEP BY STEP PROCESS

1. Set-up a test environment
2. If you have the old app, update to the latest and last version 20.02.
3. Check SSL Certificate is current.
4. Check Document viewing is set up correctly for the new app.
5. Update TRACCS desktop to 21.01 or later (preferably latest version)
6. Update Webservice
7. Run Readiness Scripts
8. Check Document Management folder setup
9. MTA User Configuration Adjustments: See Further Notes.
10. Update to new TRACCS Mobile app

FURTHER NOTES

5. UPDATE TRACCS DESKTOP

NB: If you are running an older version of MTA, you must update this to the latest 20.02 version of the app before updating the TRACCS desktop. The latest version of TRACCS (21.01 onwards) makes some changes to support the new mobile app's functionality, which is incompatible with very old versions of the previous app.

In the test environment, update TRACCS Desktop with the latest version no# 21.01 or later. The TRACCS version #21.01 or later contains changes to Configuration Settings for the Mobile App, and it will not work without them. The new settings impact the app's ability to email notes and incidents and how it finds documents on the central TRACCS database.

TRACCS desktop versions must be updated in the correct order. If your current TRACCS version is seriously out of date for advice, contact Iain Jordinson at jordo@systemet.com.au. Calls to Systemet may involve a service call fee.

6. UPDATE WEB SERVICE

In the test environment, update the Web Service with the file provided in the software pack. The latest version of the web service is essential to run the new mobile app 2021. The old app and the new app **will not** work correctly with interchanged web service link if two **web services are active**. The old app will work correctly with the new web service, but the new app will not work with the old web service.

7. RUN READINESS SCRIPTS

In the test environment, run readiness scripts provided in the software pack. The scripts conduct a database check to ensure all settings are favourable for the app.

8. DOCUMENT MANAGEMENT SYSTEM

If you currently view documents on the old app, be aware that the new web service/app requires a specific folder setup for document management. It would be best to determine what folder setup changes are necessary to successfully view documents on the new mobile app. For advice, contact Iain Jordinson at jordo@systemet.com.au. Calls to Systemet may involve a service call fee.

9. MTA USER CONFIGURATION ADJUSTMENTS

Email Notification of Incident/Notes Setting in the MTA User Configuration profile is included in *version 21.01.001* onwards of the TRACCS desktop. Some clients are not running email accounts on company devices, so there is now a toggle in the user settings to turn on/off email notifications. Before installing the new mobile app on a test device, go to the latest version of the desktop TRACCS and check this setting is to your preference. When TRACCS versions 21-01.001 or later is applied, this setting should be turned on.

Use Shift Report as Op Note Setting – also in MTA User Configuration is a toggle/checkbox to display the short OP Note format or longer Shift Report format in Client Note screen.

Use Shift Report as Service Note Setting – also in MTA User Configuration is a toggle/checkbox to display the Shift Report format with links to goals and strategies, or the short Service Note format. This option is listed on the Client Menu either as Service Note or Shift Report.

The email settings are in the individual user configuration section. If you have hundreds of employees using the app, contact Adamas Helpdesk at support@adamas.net.au, and helpdesk staff will provide you with a script that will turn the settings on or off.

10. UPDATE TO NEW MOBILE APP

Firewall Check

If you have installed the new app as per the Installation Guide, but it's not working after setting the server link and attempted to log in, it may be a firewall issue.

A quick way to work out if there is an issue with the firewall is that the soap interface should be available from a web browser.

If the user cannot see the web interface from a browser, get them to hit it internally. If it comes up internally and not externally, then it is a firewall/router issue.

The internal address for them to test would be the same as above or http://INTERNAL_SERVERNAME/timesheet.

8 GO LIVE ADVICE

Adamas can support clients during the Testing Phase and Go Live, but it will involve a service fee for project management services.

Some tips for the Go Live phase.

- 1. Do a test go live.**

This is not always possible to do, but if you can, then we would recommend going through the go-live process before the live event to help identify any issues which you may have missed during your planning process.

- 2. Have a rollback plan.**

It would be best if you did not embark on a go-live without a rollback plan. Implementing your rollback plan should not be considered a go-live

failure. Too many IT projects only become IT disasters when the go-live goes badly – sometimes very publicly. It is better to rollback, understand what went wrong, fix it, and then reschedule the go live rather than implement fixes during the go-live process or mopping up afterwards.

3. Do not go live on a Friday or Festive Season

This one may be difficult to stick to. However, our experience project goes live on a Friday are riskier, so we always avoid them. If a project goes live on a Friday, it may initially appear to be working fine, but what happens if problems are identified late in the day or over the weekend when the technical team may be unavailable. Monday to Thursday go-lives helps avoid delays in getting fixes sorted out quickly.

4. Are your users ready?

Have the implications of changes been thoroughly analysed and communicated? Are users ready for the changes to their workflows? Does the organisation understand the secondary effects of these changes on adjacent workflows? Are user staff sufficiently trained on the new system? Will there be enough staff available during cutover to deal with the new system's learning curve and processes and work through unforeseen issues?
